OFFICES IN  
MINNESOTA**

PAGE 9

July 31, 2012

Dear CONSUMER REPORTS readers,

We are pleased to present a special insert on Minnesota physician practices in the October 2012 edition of CONSUMER REPORTS. The Ratings shown in the following pages come from data provided by MN Community Measurement. That nonprofit organization has worked with physicians, hospitals, health plans, employers, and consumers since 2004 to improve health care and reduce cost, in part by collecting, validating, and publicly reporting data on physician performance.

The Ratings we present here focus on the quality of care provided to patients with diabetes, cardiovascular disease, or both. Getting a good score is hard work, since it depends on physicians meeting multiple targets in treating those diseases, such as lowering blood pressure and cholesterol levels, and requires that patients participate, by, for example, taking medication as directed and stopping smoking. Minnesota doctors deserve applause for their willingness to collect the data, make it public, and collaborate with Consumer Reports and MN Community Measurement to make it widely available to consumers. They are among the first in the nation to do so. You can learn more about the quality of physician care by going to the organization's website, at [myhealthscores.org](http://myhealthscores.org).

Sharing performance data about providers is important for several reasons. First, it generates conversations among doctors about changes they can make in their practices to lift the quality of care they provide to patients. And making this information available to patients leads to one of the most powerful forces driving improvement—educated health-care consumers.

We are able to do this project in part because of a generous grant from the Robert Wood Johnson Foundation related to a unique program called Aligning Forces for Quality. That program is the Robert Wood Johnson Foundation's signature effort to lift the overall quality of health care in 16 targeted communities (including Minnesota), reduce racial and ethnic disparities, and provide models for national reform. We think this effort is a good example of the foundation's unprecedented commitment of resources, expertise, and training focused on turning proven practices for improving quality into real results.

We hope you find this information useful.

Sincerely,

A handwritten signature in black ink, appearing to read "John Santa".

John Santa, M.D.  
Director  
Consumer Reports Health Ratings Center

# How does your doctor compare?

We rated 552 Minnesota practices on two important measures

**FINDING INFORMATION** about doctors isn't easy. The top-doctor lists found in magazines and on websites are usually based on little more than reputation or anecdotal reports. But now, through a unique collaboration, we've rated 552 Minnesota physician practices to help you learn about the doctors and nurses who are key partners in managing your family's health.

These Ratings are based on data collected by the practices themselves on how well their patients control two of the most common and deadliest chronic diseases: diabetes and cardiovascular disease, which includes heart disease, stroke, and peripheral artery disease.

How do Minnesota practices stack up? Pretty well. We found clinics delivering high-quality care for diabetes and cardiovascular disease throughout the state, and 37 practices earned our highest rating in

both categories. That shouldn't be surprising: Minnesota has the best performing health-care system in the country, just edging out Wisconsin, according to a recent report from the Agency for Healthcare Research and Quality. The same analysis showed that the state was rated above average in all but one measure of diabetes care, and average or above average for heart disease measures.

The news isn't all good: 66 practices earned our lowest score for diabetes care, 50 got our lowest score for cardiovascular care, and 24 for both.

**37 clinics earned our highest score for diabetes and vascular care.**

While this report is most important if you already have diabetes or cardiovascular disease, it's relevant for other people, too. Heart disease remains the leading killer of Americans and contributes to about one in five deaths in Minnesota. Similarly, diabetes is reaching epidemic proportions, affecting about 25 million adults nationwide and about 20 percent of Minnesotans. Even more troubling is the rising incidence of type 2 diabetes among children: Some 215,000 Americans under age 20 now have diabetes. So it pays to make sure that you and your doctor are doing all you should to protect yourself against both diseases.

## Measuring medical care

To rate the practices, we teamed up with Minnesota Community Measurement (MNCM), a non-profit group that works with health plans, medical groups, physi-

## North Star State success stories

The 37 physician practices listed below are the only ones in the state to earn our highest score for caring for both diabetes patients and cardiovascular disease patients. Eleven of them belong to the Park Nicollet group, eight to the Allina Medical group, six to Entira Family Clinics, and three to HealthPartners.

Most of those practices are in or around the Twin Cities. But clinics from other regions are represented, too. The Mankato Clinic in this list, for example, is in Mapleton, in the Southeast region of the state. And two clinics—the Allina Medical Clinic in Prescott and Ellsworth Medical Clinic—are in Wisconsin, but serve patients who live or work in Minnesota.

Entira Family Clinic's practice on Bellaire Avenue in White Bear Lake, which until recently was called Family HealthServices Minnesota, had the highest percentage of patients meeting all the targets for both vascular disease and diabetes. Bruce Leppink, M.D., a quality representative at the clinic, says that success came after he, his colleagues, and the staff decided that "mediocrity was no longer acceptable."

They identified patients who weren't meeting their goals for high blood pressure, cholesterol, and other measures, and developed plans, with patients, detailing the specific changes they needed to make. "My patients are now much more interested in their numbers and how they can work towards their goals," says Leppink. "Some of my elderly patients have even put the sheet on the refrigerator so their grandkids can see that Grandma got an A," says Leppink.

Christopher Tashjian, M.D., a physician at the Ellsworth clinic, says improvement in his practice came when the whole staff—including other caregivers and administrative staff, not just doctors—were involved in quality-improvement initiatives. "We realized disease management is a team sport. We provide measurably better care when we include the diabetes educator and care coordinator," he says.

The staff at the Ellsworth clinic saw another big improvement after the clinic started using electronic medical records, which enabled the staff to more carefully track their patients. "We are a small practice," Tashjian says. "We don't have an IT department. Our feeling is that if we can do it with the limited resources, anyone can."

cians, hospitals, employers, and consumers to improve health care and reduce cost. MNMCM has measured and reported health-care quality data since 2004, and is at the forefront of health-care ratings in Minnesota and nationally.

These Ratings include medical practices that treat diabetes and cardiovascular disease. Among them are primary-care doctors as well as specialists in geriatrics, cardiology, and endocrinology. The Ratings criteria are rigorous; a practice's score is based on the percentage of its patients who achieve all of the targets for the best management of the two conditions. That means controlling blood pressure and cholesterol levels and, in the case of diabetes, their blood sugar level, too. It also means that these patients are not smoking or using other tobacco products, and are taking low-dose aspirin when appropriate to prevent heart attacks.

Meeting all of those goals is difficult, but possible. Overall, 68 practices earned our top score for diabetes care, indicating that at least half of their patients reached all five treatment goals for the condition. The statewide average is 38 percent. The Fairview Clinic in Rosemount and Entira Family Clinic on Bellaire Avenue in White Bear Lake set the standard with 60 percent of patients reaching the targets, and several other practices were nearly as high.

For cardiovascular care, 75 practices earned the highest rating. Mankato Clinic in Lake Crystal set the benchmark, with 72 percent of its patients meeting the four optimum treatment targets in that category. The statewide average is 49 percent.

Of course, doctors can't get high scores on their own. They can't force patients to eat better, exercise more, quit smoking, and take their medications. In addition, low-income patients may have limited resources to manage their care, so doctors who treat a lot of low-income patients may face greater challenges in helping their patients to meet all five goals. But research suggests that doctors do play a major role in encouraging patients to make lifestyle changes and stick with treatment plans.

Our guide on the following pages can help you evaluate the care you receive, get the best diabetes and cardiovascular care from your doctor and, if necessary, identify a clinic that might be a better fit for you. But don't stop there. You can also see how well your practice rates in 14 other important measures at [myhealthscores.org](http://myhealthscores.org).

## Top-scoring practices

(Listed by their performance.)

**Entira Family Clinics** – White Bear Lake, Bellaire Ave.

**Fairview Clinics** – Bloomington

**Park Nicollet Clinic** – Golden Valley

**Park Nicollet Clinic** – Prairie Center

**Western Wisconsin Medical Associates** – Ellsworth Medical Clinic

**Edina Sports Health & Wellness**

**Park Nicollet Clinic** – Maple Grove

**Park Nicollet Clinic** – St. Louis Park Internal Medicine

**Mankato Clinic** – Mapleton

**Entira Family Clinics** – Gorman Clinic

**Allina Medical Clinic** – Buffalo

**Entira Family Clinics** – White Bear Lake, Banning Avenue

**Park Nicollet Clinic** – Wayzata

**Park Nicollet Clinic** – Burnsville

**Entira Family Clinics** – Shoreview

**HealthPartners** – Arden Hills

**HealthEast** – Cottage Grove

**Fairview Clinics** – Eagan

**Entira Family Clinics** – Highland Family Physicians

**HealthPartners** – Elk River

## Control blood pressure

**Goal:** Patients with either diabetes or cardiovascular disease should aim for blood pressure levels below 140 over 90. (The first number shows your systolic pressure, which is the pressure in the arteries when your heart contracts. The second number is the diastolic pressure, or the pressure when the heart is at rest.)

**Why it matters:** High blood pressure usually has no obvious symptoms, but it triggers more heart attacks and strokes in the U.S. than any other cause. Increased blood pressure can damage blood vessels throughout the body, which can also increase the risk of kidney damage, vision loss, arterial blockages in the legs, and sexual dysfunction. It can also force the heart to work harder and increase the risk of heart failure. One in five Americans with high blood pressure don't know they have it, and 65 percent aren't adequately treated. So it's important for your doctor to detect high blood pressure early, before too much damage is done.

**What you can do:** People with high blood pressure should have a doctor check their levels frequently, and consider using a home blood-pressure monitor, too. Other people should get checked at least every two years, and more often if you're 50 or older or have other risk factors. In fact, it's a good idea to have it done during every visit to a health-care provider.

If you are diagnosed with high or borderline-high blood pressure, several lifestyle changes can help you lower it:

- **Eat better.** A diet low in sodium and high in fruit, whole grains, and vegetables can reduce systolic blood pressure by as much as 8 to 14 mmHg. Just cutting back on dietary sodium to no more than 2,400 milligrams a day, might be worth 2 to 8 mmHg off your blood pressure.
- **Lose weight.** Every 11 pounds you take off may reduce your systolic blood pressure by as much as 2.5 to 10 mmHg.
- **Exercise.** Engaging in a regular aerobic physical activity, such as brisk walking at least 30 minutes a day, most days of the

**PRESSURE TO SUCCEED** Minnesota clinics, on average, helped 84 percent of patients with diabetes or vascular disease achieve optimum blood pressure control.

week, may shave 4 to 9 mmHg off your systolic pressure.

- **Drink moderately, if at all.** Limiting consumption to no more than two drinks a day for men, and no more than one drink a day for women, might help reduce blood pressure by 2 to 4 mmHg.
- **Consider medication.** If healthy lifestyle changes alone don't adequately lower your blood pressure, or if your levels are very high, drugs are often necessary. The best first choice for many people is a diuretic, particularly a thiazide diuretic. They're effective, safe, and available as low-cost generics. Other drugs, such as beta-blockers or ACE inhibitors, can also be good choices, either alone or with a diuretic.

## Lower your bad cholesterol

**Goal:** Patients with diabetes or cardiovascular disease should get their LDL (bad) cholesterol below 100 milligrams per deciliter (mg/dL).

**Why it matters:** High cholesterol levels contribute to about 420,000 heart attacks and strokes in the U.S. each year. Yet most people don't know their level of LDL cholesterol—the kind that contributes to heart disease by dumping cholesterol in the artery walls. Of those who do, many don't lower their level to recommended targets, in part because they fail to make the lifestyle changes that have been found

to help or, when necessary, take the right medication. High LDL levels are especially worrisome for people with diabetes, since they face a greater risk of heart attacks.

**What you can do:** People with diabetes or cardiovascular disease should have their cholesterol checked at least every year. Men 35 and older without those conditions should get a complete lipid profile—which measures LDL and HDL (good) cholesterol levels, as well as triglycerides, an artery clogging fat—at least every five years. Women 45 and older who are at risk for heart disease often should, too. Younger people could also consider testing, especially if they have risk factors.

Those with high or borderline cholesterol should consider these steps:

- **Eat a heart-healthy diet.** Reduce saturated fats, found mainly in red meat and full-fat dairy products, and eliminate trans fats or partially hydrogenated oils, found in margarine, many fast foods, and store-bought pastries and other baked sweets. Limit dietary cholesterol to less than 200 milligrams per day. Get plenty of fiber, mainly from whole grains, fruit, vegetables, and beans.
- **Control your weight and stay active.** That can raise your HDL and might lower your LDL, too.
- **Consider medication.** If you have high cholesterol and can't control it with life-

### ▶ FOR MORE ABOUT THESE RATINGS

Scan the code at right with your smart phone QR code reader to access MN Community Measurement's website, which has more information about Minnesota health care ratings.

style changes, you will probably need a prescription drug, usually a statin such as lovastatin, pravastatin, or simvastatin or, if you have had a heart attack and your LDL is highly elevated, atorvastatin (all of which are available as low-cost generics).

### Consider low-dose aspirin

**Goal:** People with heart disease, including those who also have diabetes, should

take low-dose aspirin unless they are at high risk of stomach bleeding or other side effects, or are allergic to it.

**Why it matters:** Aspirin can prevent artery-blocking blood clots and ward off heart attacks and strokes. But research suggests that only 20 percent of the women and 14 percent of the men who should be taking it are doing so.

**What you can do:** Most people with car-

diovascular disease or diabetes should be on aspirin therapy. But because aspirin can pose serious risks, notably gastrointestinal bleeding, don't start it without talking to a doctor first. If you do take aspirin, make sure you take it safely:

- Stick with low-dose, 81-mg (baby) aspirin. Research generally suggests it is as effective as standard adult tablets (325 mg) and is less likely to harm the gut and cause

## Three Minnesota health-care myths

Our Ratings of physician practices in Minnesota challenge some common assumptions about health care in the state.

### Myth 1. Practices in the Twin Cities are better than those in the rest of the state.

Most of the top-scoring practices statewide were in indeed in the Twin Cities or surrounding suburbs, perhaps because practices there have collected the data used in the Ratings longer than others in the state and used the results to improve their care. But the difference between the average score for the Twin Cities and the rest of the state was minor. Moreover, several of the lowest-scoring groups were also in the area, and Minneapolis itself was one of the lower-performing regions in the state, on average. That might be because the city has a greater proportion of the state's uninsured and poorer patients, and research suggests that people who live in those areas tend to have more, and more severe, health problems. Finally, some of our top-scoring groups were as far away as Mapleton, south of Mankato, and Ellsworth, Wisc.

### Myth 2. Well-known medical groups, such as the Mayo Clinic, provide better care than less familiar ones.

Again, there is some truth to this idea, as practices associated with groups such as Allina, Entira, and Park Nicollet did score better, on average, than some other Minnesota practices. But even within well-known groups there is a wide range of performance. For example, among the 39 practices in the state associated with the Mayo Clinic in 2011, the percentage of patients receiving optimal diabetes care ranged from a low of 17 percent for its practice in New Prague, to a high of 52 percent for its practices in Mankato, North Mankato, and La Crescent. For cardiovascular care, the scores ranged from a low of 19 percent of patients in New Prague receiving optimal care, to a high of 69 percent of those

in Rochester's Northwest Clinic. Clinics affiliated with Allina and Park Nicollet also showed variability, though not as wide as Mayo's. Of the medical groups with more than one clinic, the top-performing group for both cardiovascular and diabetes care was Entira Family Clinics (formerly Family Health Services Minnesota), which has 12 practices in the East Metro region. It had a range of just 20 percentage points between its highest- and lowest-scoring practices for optimal diabetes care.

Mark Nyman, M.D., a member of the Mayo Clinic's Clinical Practice Quality Committee, says several factors can explain the different scores for clinics in the same group. That can include differences in the quality of care provided, but also some issues outside of the practice's control. For example, Mayo's Specialty Clinic in Rochester might get lower scores than others because it tends to see very sick patients who have traveled to the clinic from elsewhere in the state or country, and then return home where treatment recommendations are implemented.

### Myth 3. Community health centers can't provide good care.

Fifteen of these clinics—which provide much needed medical care mainly to low-income patients, the uninsured, recent immigrants, or those who live in underserved areas—are included in our Ratings. On average, they did score lower than other Minnesota practices. But, as with the well-known medical groups and Twin Cities practices, there was wide variation among them. Moreover, the lowest-scoring practices in the state weren't community health centers, and some of the centers outperformed many other clinics. "That's actually quite impressive," says John Santa, M.D., director of the Consumer

Reports Health Ratings Center, "when you consider that they take all patients regardless of their ability to pay, 70 percent of whom are below the poverty line."

Scenic Rivers Health Services, a group with five community health centers across the rural Northeastern region of the state, exemplifies the variation. Its clinics at Bigfork and Big Falls (they are rated together because they share the same staff) are among our top-scoring community health centers in diabetes and cardiovascular care, and about average for all

practices in the state for both measures. But the group's Cook community health center was among the lowest scoring community health center in both measures.

Jeffery Scrivner, M.D., medical director for Scenic Rivers, says that early on Bigfork adopted practices, such as preappointment planning and maintaining regular telephone contact between visits, that provide a consistent and comprehensive approach to chronic care. Cook, on the other hand, has a long-standing physician shortage and sees many vacationing patients who aren't around the full year for chronic disease management. But Cook is improving, he says, and will begin to implement some of the quality initiatives that have been successful at Bigfork.

**Bottom line.** Our analysis suggests that when it comes to quality health care in Minnesota, don't put too much stock in location or name. High-scoring practices can be found in both rural and urban areas, and among those affiliated with famous groups, as well as those with less famous names. The highest-scoring community medical centers outscore 60 percent of practices for optimal diabetes care, showing that high-quality care can occur anywhere.

other complications. The one exception is if you think you're having a heart attack. In that case, call 911, then chew and swallow a 325 mg tablet.

- Protect your gut. If you have a history of stomach bleeding but your doctor says you need low-dose aspirin anyway, ask about adding a stomach-protecting drug.
- Don't stop on your own. Stopping abruptly eliminates the protective benefits of aspirin and might elevate risk beyond original levels by making the platelets in the blood more likely to form clots. If you do need to stop, possibly before surgery, for example, talk with a doctor first.
- Don't combine aspirin with related pain relievers. Drugs such as ibuprofen (Advil and generic) or naproxen (Aleve and generic) are chemically related to aspirin, so taken together, they multiply the risk of stomach problems. So if you need pain relief, try acetaminophen (Tylenol and generic) or creams such as Zostrix that contain the topical anesthetic capsaicin.

## Stop smoking

**Goal:** Don't smoke. That's important for everyone, but especially for people with cardiovascular disease or diabetes.

**Why it matters:** Smoking increases the risk of blood clots, which can cause heart attacks and strokes. It also elevates blood pressure and damages the lungs. Smokers are two to four times as likely to develop heart disease; as many as 30 percent of all heart-disease deaths in the U.S. each year stem from cigarette smoking. Smoking is especially dangerous for people with diabetes. Kicking the habit cuts your heart-disease risk dramatically. The longer you've quit, the lower that risk is likely to become.

**What you can do:** While it's hard to stop, it's not impossible: About half of all Americans who ever smoked have managed to quit permanently—though they often need help from counseling, medication, or both. Your doctor should offer you support. If he or she doesn't, ask. Nicotine-replacement products—including over-the-counter patches, chewing gums, and lozenges, and prescription nasal sprays or inhalers—help most during the first few months, when the risk of relapse is highest. People who continue to experience intense cravings may need to use the products longer, but they should do so under a doctor's supervision because of the risk of addiction to the replacements.

## Manage your blood sugar

**Goal:** People with diabetes should have an A1C level, which reflects the average blood sugar level over the previous three months, of less than 8.

**Why it matters:** As the number of people with type 2 diabetes has multiplied in recent decades, so has the number of heart attacks among those with the disease. And roughly a quarter of the U.S. population has prediabetes. They usually have no symptoms, and most don't even know that their blood sugar is a bit high. But most of them go on to develop full-blown type 2 diabetes. Even if they don't, they face an increased risk of a heart attack or stroke, possibly cognitive decline, and certain cancers.

**What you can do:** People with diabetes should check their blood sugar levels frequently. Adults who are at high risk for the disease should have levels measured at least every three to five years.

The same steps that can help you ward off high blood pressure and high cholesterol levels—weight control, staying active, and consuming a heart-healthy diet—can help you avert diabetes. Losing weight might be the most important. Researchers estimate that about 70 percent of type 2 diabetes cases are largely due to excess body fat.

Medication designed to control blood sugar levels can help people who have diabetes prevent certain complications of the disease, such as vision problems and nerve damage, but they have not been found to help prevent heart attacks. A good first choice for most people is metformin, which is available as a low-cost generic and has a proven record for safety and effectiveness. But many people need more than one medication to control blood sugar. And your choice of diabetes drugs does have implications for heart health, so consider them carefully with your doctor.

## What to do if your doctor gets a low score

Of the 552 physician practices in our Ratings, 66 earned our lowest score for diabetes care, 50 got our lowest score for cardiovascular care, and 24 our lowest score for both. What should you do if your doctor's practice is one of them?

First, don't panic and fire your doctor—at least not until you've discussed the results. For one thing, Minnesota ranks first in the country in many measures of health care and is above average in most aspects of diabetes and cardiovascular disease care, so a practice that scores below average in Minnesota might still be average or better compared with practices elsewhere in the country.

In addition, it's important to understand why your physician's practice score is low; in some cases there are good explanations. For example, Bluestone Physician Services, in Stillwater, got our lowest score on both Rating measures. But they mainly care for frail, older people, who often choose comfort over interventions. In those patients, strict adherence to blood pressure or cholesterol goals by, for example, prescribing drugs that can cause side effects might not be as appropriate as it is for younger people—and it's often harmful. In some other cases, low scores might indicate that a practice treats lots of patients who are uninsured or live in poverty and have fewer resources to manage their health.

Most important, what really matters is the care you get from your doctor, not the

practice's overall score. Are your blood pressure, cholesterol, and blood sugar levels under control? Did your doctor talk with you about taking low-dose aspirin and giving up tobacco (if you use it)? If so, you and your doctor might be a good fit regardless of the practice's score. That's especially important to keep in mind if you have a good relationship with your doctor, as well as the nurses, receptionists, and other staff members in the office.

But you shouldn't necessarily start looking for a new doctor even you aren't satisfied with your care. After all, finding a new doctor can be hard, and there are real benefits of sticking with a primary-care doctor who is familiar with you and your medical history.

Instead, use our Ratings as an opportunity to talk with your doctor about how you can work together more effectively to manage your health. Ask what the practice is doing to improve its performance, and whether its scores are moving in the right direction. And remember that your participation is key, too. Your doctor can only make recommendations; you have to follow through on them.

**Bottom line.** If your doctor is unwilling to have that conversation with you, or if things don't improve, then it might indeed be time to seek care elsewhere. And in that case, our Ratings can be a good starting point for finding a new one.

## What's behind the Ratings?

These Ratings of physician practices are published in conjunction with Minnesota Community Measurement. That nonprofit organization works with physicians, hospitals, health plans, employers, consumers, and the Minnesota Department of Health to improve health by sharing information on health-care quality, patient experience, and cost. Physician practices in Minnesota are required by the state to report data to MNMCM, which then validates and publicly reports the information.

The data shown here are from 2011, and they come from medical records submitted by the practices to MNMCM. The results are for physician practices, not individual doctors, and include 552 primary-care practices in 11 geographic regions, including 20 practices in North Dakota and 15 practices in Wisconsin that are near the Minnesota border.

### How are practices rated?

Practices are rated based on their success at helping patients achieve key targets in managing diabetes and cardiovascular

disease, which includes heart attacks and strokes. Those targets are: not using tobacco products; taking low-dose aspirin when appropriate; and controlling blood pressure and cholesterol levels and, in the case of diabetes, blood sugar levels. We show the percentage of patients with diabetes or cardiovascular disease who achieve all of those goals for each condition. Those percentages are then translated into a 1 through 5 scale, which are distinct for each condition. The higher the number, the better the care.

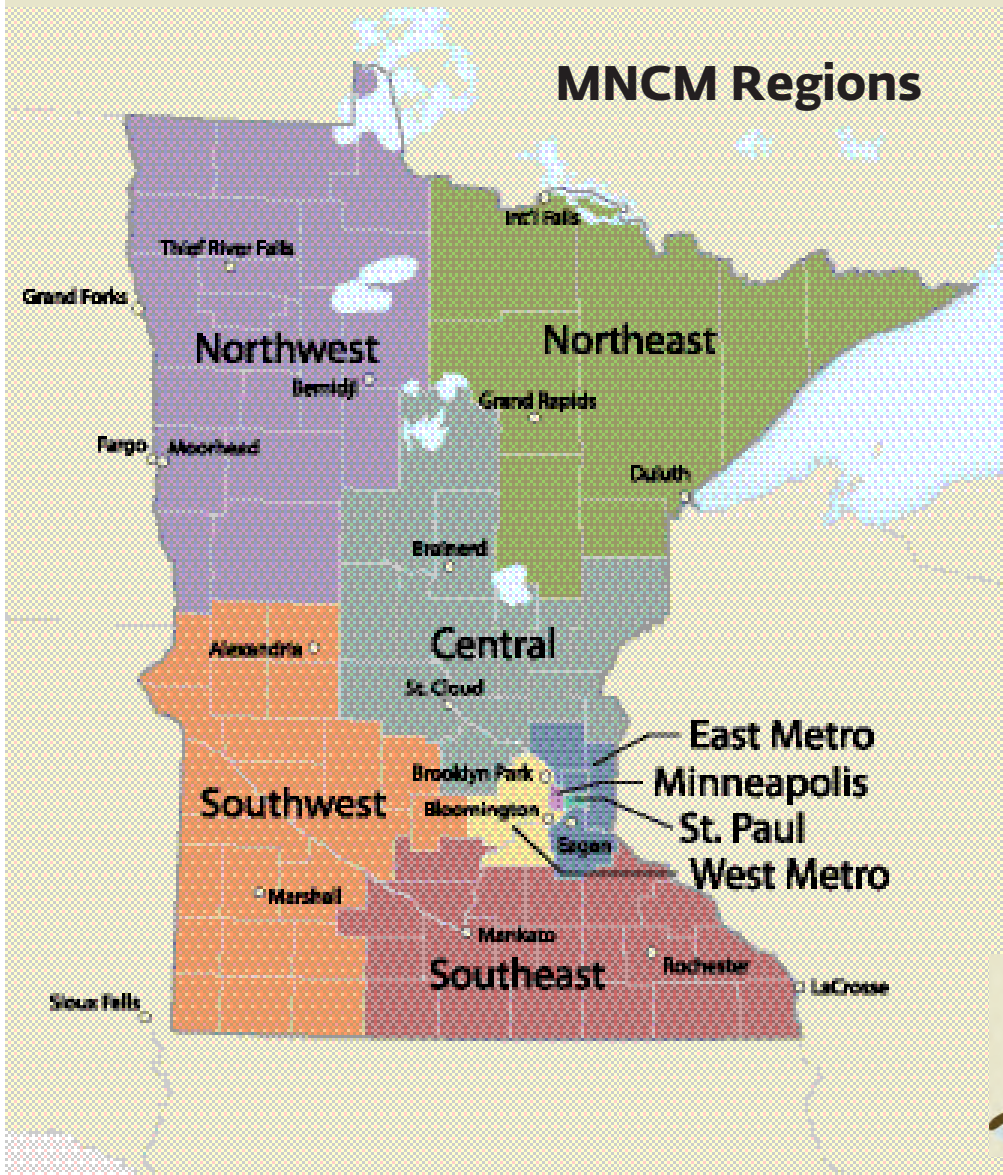

### What do the scores mean?

Practices within regions are ranked in order of their performance statewide, based on the percentage of diabetes and cardiovascular disease patients combined who achieve optimal care. If a practice treats more of one kind of patient than another, that percentage counts more in the rank order. If a practice does not have a score for either diabetes or cardiovascular disease, it did not have enough patients with that condition to be included or did not submit data for that measure. The rank order is based on both diabetes and vascular care, even if one of those measures did not have enough data to earn a score. If a practice is not included at all, it did not have enough data or submit data for either measure.

Small differences in score don't mean much; look for large differences, and talk with your doctor if you have concerns. These Ratings provide information about certain important aspects of patient care, but they don't tell you everything you need to know. A practice may sometimes receive a low score but still provide quality health care in other ways.

### Where can I find more details?

Go to MNMCM's website, [myhealthscores.org](http://myhealthscores.org). There you can find data and technical details about these Ratings, as well as information on how practices perform on other measures, such as patient experience; the care of asthma, colorectal cancer, and depression; and the use of health-information technology. Use your smart phone to scan the code on page 5 and access MNMCM's website.

This report is based on data from MN Community Measurement, a participant in the Robert Wood Johnson Foundation's Aligning Forces for Quality initiative. Aligning Forces is the Foundation's signature effort to lift the overall quality of health care in targeted communities throughout the country, reduce racial and ethnic disparities, and provide models for national reform. One core requirement of the program is that participating communities publicly report the type of data used here.
