HOW DOES YOUR DOCTOR COMPARE?

The Ratings of primary care physician groups help consumers in eight states evaluate practices on key measures

EVERYONE NEEDS a primary care doctor. That's the person who knows you best, refers you to specialists, and follows up on care. But what do you look for when choosing a primary care doctor?

"For many people, the most important thing is that they like their doctor," says John Santa, M.D., a medical consultant for Consumer Reports who has studied the qualities that make a good physician—and how to measure that—for more than two decades. "They want to feel that their doctor listens and understands them."

Just as important, Santa says, is "whether your doctor is skilled at what he or she is paid to do—keep you healthy, help you recover from an illness or injury, or help you manage a chronic disease, like diabetes or high blood pressure."

You might think it would be easy to find out how well physicians perform those essential functions. But it's not, for several reasons.

To start, there's the size of the doctor population: Almost a million practicing physicians are in the U.S. And roughly half are primary care doctors. Who is responsible for gathering information on them all?

At least as problematic: How is a doctor's performance measured, anyway? After all, primary care doctors take on many tasks—from ordering cancer screening tests to treating infections, from managing chronic diseases such as heart

disease to coordinating care with specialists. So which criteria exactly should they be judged on?

Once those questions get answered, how are physicians persuaded to share that information—or where can interested parties go to gather it? And how can the information be presented in a way that's accepted by medical professionals as accurate and fair, and still be useful to patients?

First Steps

A network of patients, doctors, hospitals, employers, and insurers from 40 regions across the country, funded in part by the

Robert Wood Johnson Foundation, has over the past several years tried to tackle those problems.

"There's currently little ability to compare physician practices even in the same community, let alone across the country," says Elizabeth Mitchell, president and CEO of the Network for Regional Healthcare Improvement, a nonprofit organization involved in efforts to make physician reporting more standard and transparent. "We need to correct that, so doctors can see how they can improve and so that patients can get information they need to choose doctors."

As part of that effort, eight of those regions—California; Massachusetts; Maine; Minnesota; Washington; Wisconsin; the greater Columbus, Ohio, area; and the greater Detroit area—have agreed to publish Ratings of physician groups in Consumer Reports magazine. "It's an important step in bringing this information directly to consumers," Santa says. "But it also shows how hard it is to rate doctors and how far we still have to go."

For example, some of those regions are much farther along in their efforts than others. Minnesota has now gathered information on nearly all of the primary care providers in the state, thanks largely to a state law that has required doctors to gather and publicly share that information since 2010.

In other states reporting is voluntary

or limited to physicians affiliated with certain health insurance plans or large medical groups. In Massachusetts, for example, the data come from physicians who belong to the state's five largest commercial health insurance plans. In California, the information is limited to doctors who are affiliated with health maintenance organizations. And in Columbus the data come from five of that region's medical groups. So in most of the regions, the information is available for only a subset of physicians.

"These regions all deserve credit for pushing for this effort, as do practices that have agreed to share the information—especially those who may not do so well," Santa says. "That takes courage and a commitment to honesty and transparency—qualities that are also essential to good medicine."

What We Measure

The Ratings Consumer Reports is publishing for each region focus on how well doctors provide evidence-based care for common health problems. Depending on the specific region, those include health concerns such as diagnosing back pain, treating diabetes or heart disease, and how often they provide the right screening tests for breast cancer, colon cancer, and cervical cancer.

"We focused on those areas because

TIPS ON USING THESE RATINGS

1 Check to see whether your doctor's practice, group, or clinic is listed. If it is, see how it compares with others in your area. If it doesn't do as well as others, ask your doctor why, and what the group is doing to improve.

2 If your group is not listed, ask your doctor why it doesn't participate. And ask whether the practice knows how it performs on those measures, even if it doesn't publicly report. Many do have that information. If you're not satisfied with the answers you get, you could consider looking for another group.

3 Gather other information on your physician. That includes everything from whether the doctor accepts your insurance to whether he or she has been disciplined by a state medical board for inappropriate behavior or dangerous care. See "What You Don't Know About Your Doctor Can Hurt You," on page 30 of the May 2016 issue of Consumer Reports magazine for advice on where to go for that kind of information.

they all relate to important, widespread health problems and because how well physicians perform in those measures may provide some indication of their overall quality of care," says Jim Chase, president of MN Community Measurement, the Minnesota organization that has been collecting and reporting data on physician performance since 2003.

Individual Doctors vs. Groups

In all eight of the regions, the Ratings apply not to individual doctors but to groups of physicians, usually relatively small practices that work together in the same office or clinic.

That focus on groups rather than individual doctors is partly because to get statistically meaningful results requires lumping together the results of multiple physicians.

But there's another reason. "Yes, your specific doctor is important," Chase says. "But physicians, especially today, almost always practice as part of a team, so how good a job they do also depends on how good that teamwork is."

In addition, doctors, like the rest of us, sometimes move from one job to another, or to another town or state. Because many patients stick with their physician group rather than follow their doctor, it's important to get insight into how well the whole practice performs.

Wisconsin THE POWER OF PUBLIC DISCLOSURE

These Ratings of Wisconsin physicians include information on more than 250 medical clinics, representing about 60 percent of the state's doctors.

As in most of the regions that are measuring

physician performance, participation by the clinics is voluntary. And, no surprise, practices that do well are more likely to share their data publicly than those that don't score as high.

In fact, almost half of the clinics in these Ratings earned top scores on at least two of the three measures in the Ratings, which are based on the percentage of patients who are appropriately screened for colon cancer or get their diabetes or high blood

pressure under control. And 38 clinics got high scores in all three. By contrast, no clinics received low scores in all three measures and only one got a low score in two of them.

Should you necessarily avoid clinics that earn low or average scores? "No," says Theresa Mees, chief operating officer at the Wisconsin Collaborative for Healthcare Quality, the nonprofit organization that has collected and reported data on physician

performance in the state since 2003.

For one thing, she points out that physicians in Wisconsin are compared against the national average for each measure, and Wisconsin, overall, outperforms most of the country. "So an average clinic in Wisconsin is still above average nationally," Mees says.

Second, clinics that report even when they are below average deserve credit for making their information public

despite their less-than-stellar results, Mees says.

Last, clinics that score low in particular measures may have good explanations for why they underperform. It's worth asking them why they don't do as well as others and what they are doing to improve their care, she says.

"Public reporting has prompted many patients and families to have these important conversations with their providers," Mees says.

WHAT'S BEHIND THE RATINGS?

These Ratings include information on more than 250 medical clinics in Wisconsin, representing about 60 percent of the primary care doctors in the state. The groups are listed alphabetically within regions. They are published in conjunction with the Wisconsin Collaborative for Healthcare Quality, a nonprofit coalition of health systems, medical groups, hospitals, and health plans. WCHQ has worked with those groups to improve healthcare quality since 2003, collecting and publicly reporting data on clinic performance.

How Are the Clinics Rated?

The clinics are rated on three measures:

- 1.** Colon Cancer Screening is based on the percentage of patients ages 50 to 75 who are appropriately screened for colorectal cancer.
- 2.** Diabetes Care reflects the percentage of diabetes patients ages 18 to 75 whose blood sugar levels are under control.
- 3.** High Blood Pressure is based on the percentage of adults with a hypertension diagnosis whose blood pressure levels are under control.

How Are the Scores Determined?

Ratings are divided into three categories, with 3 being better. Ratings are based on comparison with the national average for each measure. Top-rated clinics are substantially better than the average; those in the middle are average or slightly above average; and those at the bottom are worse than average.

Note that some clinics in these Ratings have scores for only two measures. That is because they either don't have enough patients to report on that measure or have not yet started collecting data on it.

In addition, clinics in the state appear in these Ratings only if they have results for at least two of the three measures.

How Should I Use These Ratings?

Check the Ratings to see whether your doctor's practice is listed and if so, how it compares to others in your area. The measures may help you compare and choose practices even if you don't need to be screened for colon cancer or you don't have diabetes or high blood pressure, because how well a group performs on those measures may indicate how well it provides care overall.

Where Can I Learn More?

Go to the website for the Wisconsin Collaborative for Healthcare Quality, at wchq.org/reporting, which includes an online version of these Ratings plus additional information on other measures. Those include how often the practices vaccinate adults against pneumonia and provide appropriate immunizations for teens, plus information on cardiovascular specialty care in the state.
